

PROGRAMMING CONCEPTS AND
EMBEDDED PROGRAMMING IN
C, C++ and JAVA:
Lesson-9: Programming using
Event or Messages Polling

1. Multitasking

Function *main* with a waiting loop

- `main ()` passes the control to an RTOS
- Each task controlled by RTOS and
- Each task will also have the codes in an infinite loop
- A waiting task is passed a signal by the RTOS to start

main () calling RTOS

- # define false 0
- # define true 1
- /******
******/
- void main (void) {
- /* Call RTOS run here */

Infinite loop in main ()

- while (1) {rtos.run ();
- /* Infinite while loops follows in each task.
So never there is return from the RTOS. */
- }
- }
- /*****
*****/

Task 1

- void task1 (...) {
- /* Declarations */
- .
- while (true) {
- /* Codes that repeatedly execute */
- .
- /* Codes that execute on an event */
- if (flag1) {...;}; flag1 =0;
- /* Codes that execute for message to the kernel */
- message1 ();
- } }
- /******

Task2 ()

- void task2 (....) {
- /* Declarations */
- .
- while (true) {
- /* Codes that repeatedly execute */
- .
- /* Codes that execute on an event */
- if (flag2) {....;}; flag2 =0;
- /* Codes that execute for message to the kernel */
- message2 ();
- } }
- /******

TaskN_1 ()

- void taskN_1 (....) {
- /* Declarations */
- .
- while (true) {
- /* Codes that repeatedly execute */
- .
- /* Codes that execute on an event */
- if (flagN_1) {....;}; flagN_1 =0;
- /* Codes that execute for message to the kernel */
- messageN_1 ();
- } }
- /******

TaskN

- void taskN (....) {
- /* Declarations */
- .
- while (true) {
- /* Codes that repeatedly execute */
- .
- /* Codes that execute on an event */
- if (flagN) {....;}; flagN =0;
- /* Codes that execute for message to the kernel */
- messageN ();
- } }
- /******

2. Polling for events and messages

Polling for events and messages

- A Programming method is to facilitate execution of one of the multiple possible function calls and the function executes after polling
- Polling example is polling for a screen state (or Window menu) j and for a message m from an ISR as per the user choice

Mobile phone

- Assume that screen state j is between 0 and K , among 0, 1, 2, .. or $K - 1$ possible states.(set of menus).
- An interrupt is triggered from a touch screen GUI and an ISR posts an event-message $m = 0, 1, 2, \dots$, or $N - 1$ as per the selected the menu choice 0, 1, 2, ..., $N - 1$ when there are N menu- choices for a mobile phone user to select from a screen in state j .

Polling for a menu selection from screen state

- `void poll_menuK { /* Code for polling for choice from menu m for screen state K*/`
- `}`
- `}`
- `/*******/`

Polling for an even like mice click or menu select

Interrupt on
menu select
key

Event *es*

ISR on User Menu Choice selection

Poll for present screen state *s* and message for menu-choice selected *m*;

Case (screen state = *s0*, menu selected = *m0*) execute function (*s0*, *m0*);

Case (screen state = *s0*, menu selected = *m1*) execute function (*s0*, *m1*);

Polling for an event like mice click or menu select

```
.  
.   
.   
Case (screen state = s1, menu selected = m0) execute  
function (s0, m0);  
Case (screen state = s1, menu selected = m1) execute  
function (s0, m1);  
.   
.   
.   
Case (screen state = sj, menu selected = mp) execute  
function (sj, mp);
```

One of Functions (s, m) called

function (s_0, m_0)

Run code

Signal

function (s_0, m_{N-1})

Run code

Signal

function (s_1, m_0)

Run code

Signal

function (s_0, m_{N-1})

Run code

Signal

⋮

⋮

function (s_j, m_0)

Run code

Signal

function (s_j, m_{N-1})

Run code

Signal

Summary

We learnt

- A program function can be initiated by polling for a signal or message sent by the operating system
- A signal or message sent by the operating system can be as per screen state or window menu and user choice
