

**PROGRAMMING CONCEPTS AND**  
**EMBEDDED PROGRAMMING IN**  
**C, C++ and JAVA:**  
**Lesson-2: Data Structures: Arrays**

# Array

- Array: A structure with a series of data items sequentially placed in memory

## Array

- (i) Each element accessible by an identifier name (which points to the array) and an index,  $i$  (which define offset from the first element)
- (ii)  $i$  starts from 0 and is +ve integer

**An array at a memory block with one pointer for its base, first element with index = 0. Data word can be retrieved from any element by defining the pointer and index**

Vector (One Dimensional Array)

# One dimensional array (vector)

Example 1:

unsigned int *salary* [11];

*salary* [0] – 1<sup>st</sup> month salary

*salary* [11] – 12<sup>th</sup> month salary

Each integer is of 32-bit (4 bytes);

*salary* assigned 48 bytes address  
space

## One dimensional array (vector)

Example 2: *sio COM* [1];

*COM* [0]– COM1 port data record with  
structure equivalent to *sio*

*COM* [1]– COM2 port data record with  
structure equivalent to *sio*

*COM* assigned  $2*8$  characters = 16  
bytes address space

## Two dimensional array

Example 3:

unsigned int *salary* [11, 9];

*salary* [3, 5] – 4<sup>th</sup> month 6<sup>th</sup> year salary

*salary* [11, 4] – 12<sup>th</sup> month 5<sup>th</sup> year  
salary

*salary* assigned  $12 * 10 * 4 = 480$  bytes  
address space

## Multi-dimensional array

Example 4:

*char pixel* [143,175, 23];

*pixel* [0, 2, 5] – 1<sup>st</sup> horizontal line index *x*,  
3<sup>rd</sup> vertical line index *y*, 6<sup>th</sup> color *c*.

*pixel* assigned  $144*176*24 = 608256$   
bytes address space in a colored  
picture of resolution 144x 176 and 24  
colors

# Summary

# We learnt

- Array: A structure with a series of data items sequentially placed in memory. Any data-element can be read or rewritten using the array pointer along with the element index(ices) in the square bracket.

# End of Lesson 2 of Chapter 5
